

NAME

installator – CADP installation assistant

SYNOPSIS

installator [-beta]

DESCRIPTION

This program installs CADP on one machine or on several machines connected by a Local Area Network. It can also be used to upgrade an existing version of CADP already installed. Installator takes in charge the following tasks:

- Inquiry about the latest version of CADP available on the FTP site of CADP,
- Download of the latest version of CADP available using the FTP protocol,
- Archive extraction and installation of CADP on the local machine or network,
- Registration of CADP using the Request For License procedure.

Although a manual installation of CADP also exists, the use of **installator** is strongly recommended, as it ensures that the installation will be done correctly and automatically.

OPTIONS

-beta download a beta-version of CADP (instead of a plain, stable version). Do not use this option unless you have been specifically advised to do so by the CADP development team.

EXIT STATUS

Exit status is 0 if everything is alright, 1 otherwise.

AUTHORS

Hubert Garavel, Aldo Mazzilli, Patrick Wendel (INRIA Rhone-Alpes)

FILES

installator is a shell script located in **\$CADP/com/installator** that launches a Tcl/Tk script to be executed by the **wish** interpreter. The source files of **installator** are available in directory **\$CADP/src/installator**

SEE ALSO

tst(LOCAL)
